

HighJump Software Adaptability

Empower Your IT Staff to Keep Pace with Business Changes

What if you could change the way your supply chain software worked to better fit your business? What if your own IT team could make these changes without modifying source code or disturbing the normal flow of your operations?

HighJump Software's flexible solutions allow you to adapt quickly and easily to changing business environments without excessive costs or disruption.

The HighJump™ Supply Chain Advantage suite of products provides a solid foundation of best practices based on hundreds of implementations in complex distribution centers, combined with the ability to create and layer on your own personalized workflows. This level of adaptability is possible through HighJump Software's unique Process Object architecture. This process-based approach means business processes can be easily configured to meet current and future requirements. Because custom coding is not required, you can drastically reduce the time, effort and expense that can go hand-in-hand with source code changes.

Our Competition's Configurability	HighJump Software: Three Levels of Configurability
<ol style="list-style-type: none">1. Switches: High-level system functions set by software provider2. Source code modifications: Performed by software provider	<ol style="list-style-type: none">1. Switches: High-level system functions set by HighJump Software2. HighJump Page Editor: Web User Interface configuration you perform3. HighJump Advantage Architect: Deep application-level process changes you perform
<p>What does it mean?</p> <ul style="list-style-type: none">• When existing system options are not enough, source code is modified, at considerable expense• Upgrading requires additional cost to have configurations brought forward by the vendor	<p>What does it mean?</p> <ul style="list-style-type: none">• System personalizations are simple to perform on your own, without assistance from HighJump• Upgrades do not disrupt your business because changes made previously automatically carry forward• Provides deeper levels of configuration for supporting your differentiating features

You can configure your HighJump system in a fraction of the time of conventional systems—and at a fraction of the cost.

HighJump Software Adaptability: Tools of the Trade

Following go-live, your HighJump system's "super-users" will be experts on configuring your application using these tools:

HighJump Page Editor: This tool provides the ability to create, change and configure Web-based pages and workflows so that you can see screens, reports and data in formats that are most relevant and valuable to you. HighJump Page Editor is easily configured with a common set of users that can be utilized across all of your Web applications. Web applications can also be published to multiple servers in a Web farm with a simple configuration change to the publishing URL.

During implementation, HighJump Software will work with your company to set up your unique Web configuration. Following implementation, a typical HighJump Software customer can use HighJump Page Editor to modify existing Webpages or create new customer-specific views. If you have staff knowledgeable in SQL they can become proficient with Page Editor in a matter of days.

HighJump Advantage Architect: This tool provides the ability to create, change and configure warehouse processes (i.e., ASN receipt, batch picking, etc.) within your HighJump solution. HighJump Advantage Architect is HighJump Software's workflow configuration tool that encapsulates the "DNA" of all the warehouse processes. This DNA comprises intelligent chunks of business logic that can be easily modified, re-sequenced and chained together to meet your business workflow requirements.

HighJump Advantage Architect also includes industry standard version control functions. These include displays of what has been checked in and out, differences across versions, application and change set history, and numerous other items.

Not only will your super-users have completed the training courses for these tools during implementation, they also will have worked alongside HighJump Software experts during the configuration phase.

How HighJump Adaptability Affects Your Bottom Line

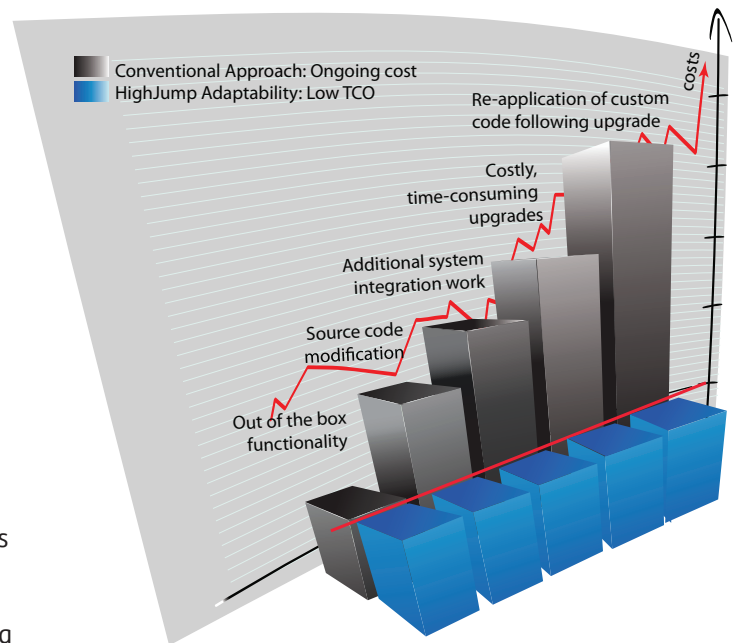

Dramatic implementation cost savings: Your system imple-

mentation and maintenance costs can be cut dramatically compared to the costs of conventional systems lacking a configurable approach.

Rapid upgrades you can perform yourself: Many HighJump Software customers perform their own upgrades. Some upgrades have been completed in less than a day.

Quick and easy incorporation of change orders: New technology is easily leveraged without business disruption, avoiding the obsolescence that occurs with many conventional systems. Software providers are continuously working to improve their technology. HighJump Software provides you with new technology that can be quickly and inexpensively applied to your advantage.

Elimination of custom code modifications: HighJump Software minimizes the risk associated with the implementation of your system by removing the need for custom coding and providing you with tier-one functionality that can be effectively implemented during your project.

"Each upgrade has been transparent to the end user. The most recent release required just a few hours of effort, and it worked perfectly right out of the box."
