

INTRODUCING AN “APP STORE” FOR YOUR SUPPLY CHAIN

The HighJump **App Station**

What if there was an “app store” for your supply chain management software? What if you could browse and add functionality to your warehouse management system (WMS) anytime—similar to how you add new apps to your smart phone? With the HighJump™ App Station™, now you can.

Problems Created by the Typical WMS

- “Our WMS has a whole lot of features we’re not even using, expanding our support costs.”
- “It’s expensive to upgrade our WMS.”
- “It’s a pain having to involve the vendor every time we need to add or change functionality—not to mention expensive!”
- “I’m concerned about the risk of messing up some other part of the application when I make a change.”

Typical enterprise software solutions are bloated with features that only a small number of customers need. That means you have to absorb all these features every time you upgrade, whether you need them or not. And because the code is all intertwined, changing one thing could cause something else to break.

The HighJump App Station Solution

The HighJump WMS enables you to make rapid adjustments to your system to meet changing market and customer requirements, without disturbing the underlying code or existing personalizations. Now, with the HighJump App Station, you have continuous access to a steady stream of new supply chain innovations—just browse the apps and add the features you need.

With the HighJump App Station You Can...

- Access a steady stream of new supply chain innovations
- Maintain only the functionality you need
- Keep scheduled upgrades quick and simple
- Personalize new apps without disturbing existing supply chain workflows
- Add functionality without costly, time-consuming custom coding
- Relax, knowing all apps in the HighJump App Station are tested and supported by HighJump Support

How Does the HighJump App Station Work?

1. Owen, the warehouse manager, needs to incorporate a new customer picking requirement into the HighJump WMS.

2. Owen asks Jack, the IT manager if there is an app for this picking requirement.

3. Jack browses the HighJump App Station, finds the picking process he needs, and downloads the app—free of charge.

4. Because apps in the HighJump App Station can be installed by your own staff, Jack has the new picking workflow up and running within a few hours, without disturbing existing WMS personalizations and without extended downtime.
